Assignment 2

Executive Summary

The Mobile phone market being considered in the world is very strong and resilient with a total revenue of approximately **11.84 billion** generated in a span of **3 years**. The sample size of **60, 000** personal sales records show about **3.2 million** units sold in **10** world markets. Prices per unit were also steady at **\$528**, implying that consumers were still willing to spend despite inflation.

Further examinations show that four large brands **Samsung, Apple, Huawei and Xiaomi** make up more than **62 %** of the overall market revenue, which serves as one of the indicators of their strong grip on consumer demand. Samsung itself, generating nearly **2.32 billion** of money has a product portfolio that enables it to earn it, unlike the premium pricing strategy used by **Apple** that makes Apple earn about **2.18 billion** even though the unit volumes are lower.

The **United States** is the market where it controls the largest share and is at the top of all markets with some **27%** of the total revenue pool, with **Canada and the United Kingdom** ranking at the second and third positions, respectively, with **22% and 18%** of the total revenue. There is also a strong channel disruption as demonstrated in the data **with online sales** projected to constitute **37.7%** of the total market revenue because of the global demand shift towards e-commerce based mobile device purchases.

The overall consumer sentiment was steadily elevated, and **the average customer rating was 4.18**, although several brands showed cyclical changes that were associated with

Assignment 2

product refreshing cycles, supply chain bottlenecks and post-introduction software problems.

On balance, the market demonstrates a positive development **due to the high rates of brand loyalty, the spread of 5G technology, and the effective digital retail platform.**

Revenue Overview

These combined revenues of the total of 11.84 billion brought in by all devices depict a stable financial environment. Quarter to quarter performance indicates anticipated seasonality:

- Quarter 1 Avg Revenue: **\$987M**
- Quarter 2 Avg Revenue: **\$1.03B**
- Quarter 3 Avg Revenue: **approximately \$1.12B (best quarter)**
- Quarter 4 Avg Revenue: **\$1.08B**

Q3 has the greatest earnings because it has a new product launch and back to school shopping. Q4 generally enjoys the sales of holidays **but Q4 revenues are still slightly lower than Q3**, which shows that promotional expenditure is not stronger than the hype of new launch.

Over the 3-year run, **the total revenue was up by 4.8 per cent Year over year**; that is, the market is growing at a moderate and consistent rate, in large part owing to the price increments and upgrades to 5G.

Assignment 2

Revenue by Brand

Brand	Approx Revenue	Market Share
Samsung	~\$2.32B	19.6%
Apple	~\$2.18B	18.4%
Huawei	~\$1.56B	13.2%
Xiaomi	~\$1.32B	11.1%
Google	~\$892M	7.5%
Oppo	~\$774M	6.5%
Vivo	~\$710M	6.0%
Others	~\$2.1B	17.7%

The competitive advantage lies in the ability of **Samsung** to maintain balance in pricing and massive inventories in various countries. **The revenue and sales of Apple** have been maintaining a tight figure even though the prices of its units are on average higher than those of its competitors by about **100-150**.

The fact that **Huawei and Xiaomi** have a combined **market share of 24%** is a good growth momentum because of the competitive prices and fast developing camera/processor products.

Assignment 2

Top Models by Revenue Contribution

The most revenue driving models are the following:

- Apple Model X Pro: \$314M
- Samsung Model 13 Ultra: 302M
- Huawei Model 4: 289M
- Xiaomi Note Series Pro: \$248M
- Google Pixel Series 7: \$210M

The five models alone produce about **1.36Billion** which is **11.5%** of the total revenue of the entire data set. Their contribution is very high demonstrating the strength of flagship-quality devices.

Units vs. Volume Dynamics

- The high-end models have an **average of 612 per unit** and **sales volume of 80-180 units** in a transaction group.
- Mid-tier models have **averages of 465 per unit** and have a little bigger volume of transactions.
- The low-end models cost **approximately \$398**, and their revenue contribution is low because of poor ratings, and they have fewer luxury features.

Flagship devices generate **2.1× more revenue** than low-tier models despite lower transaction frequency.

Assignment 2

Impact of Customer Ratings on Revenue

- Models with a **rating of ≥ 4.5** would produce around **\$212K**, with each quarter.
- The models with the **rating of ≤ 3.5** have the potential to generate approximately **147K/q.**

This **43.9% increase in revenue** is the testimony that customer satisfaction and optimization of firmware/software is directly related to financial results.

Geographic Market Analysis

Country	Revenue	Share
USA	\$3.20B	27%
Canada	\$2.63B	22%
UK	\$2.14B	18%
Japan	\$1.88B	16%
Germany	\$764M	6%
Australia	\$642M	5%
Others	\$586M	4%

North America alone contributes 49%, indicating a heavy reliance on premium markets.

Assignment 2

Market Behavior Insights

- The willingness to be paid by the USA customers is best with an **average unit price of \$560** which is almost **32 times** higher than the world average.
- Canada exhibits equal consumer behavior and buys more through **carrier channels** (promotional contracts).
- The price-sensitive customers make **UK** perform well with **mid-level Xiaomi** and **Huawei products**.
- **Japan** favor's **mid-premium** models that have stable **Year over Year growth of 5-7%**.

Revenue Distribution by Channel

Channel	Revenue	Share
Online	\$4.46B	37.7%
Retail	\$4.10B	34.6%
Carrier	\$3.28B	27.7%

The **online channel** grew nearly **9% Year over Year**, outpacing **physical** retail, which grew only **3–4%**.

Channel Level Behavior Patterns

Assignment 2

- **Online:** The most successful in **USA and UK** where the average rating of customers **(4.22)** is the highest, and the lowest returns.
- **Retail:** Can do well in **Canada and Germany** because customers like a face-to-face comparison.
- **Carrier:** Leads the sales of **Samsung and Huawei** in North America.

Strategic Recommendations

1. Increase Investment in 5G Flagship Products

5G models are **more revenue generating and are also highly effective** in every region as compared to older models. By investing more in high-quality 5G devices, it is possible to **increase the revenue by 12-18 per quarter**. The highest correlation between this segment and customer rating is also recorded.

2. Strengthening Online Channel Strategy

Online sales make **37.7 percent of total revenue** and increase **8-11 percent YoY**, as compared with retail or carrier channels. Due to the growth of digital marketing, SEO and online promotions, annual revenue can **increase by 5-7%**. Customer satisfaction is also the **highest on online channels**.

3. Expand Market Focus in UK and Japan

The UK and Japan are recording a steady growth of **5-7% per year** particularly on mid-premium devices. **New revenue potential of \$36M - 42M per annum** can be unlocked by changing the pricing and introducing model-specific to the regions. Competitive pricing and innovation are well received in these markets.

Assignment 2

4. Discontinue or Redesign Low-Rated Models

Models with a **rating of less than 3.8** will perform poorly by **31-44%** and result in over **400M in lost opportunity cost**. Eliminating or fixing weak SKUs will make portfolio profitability. This change will also place **high-rate models in a better position** of visibility and demand.

5. Align Flagship Launches with Q3 Peaks

Q3 is creating 9-14% more revenue because of the back-to-school and mid-year upgrade systems. The conversion and pricing power is maximized by **launching new models** during this period. By matching release schedules to the brand, the brand can anticipate **12-18% boosts to quarterly results**.

Dashboard Summary

Dashboard 1:

This dashboard is a top-level overview of the financial performance of the mobile device market, which recaps the trend of revenue, units sold and pricing overtime. It **contains multi-year trendlines** that indicate the evident seasonal spikes and **the Q3 displays the peak level of revenue** near to the highest one in the data, which is the level of **\$1.12B**. Comparison of revenues and units sold points at **Samsung and Apple as the main revenue anchors**, combined with other revenue sources **amounting to more than 4.5B or approximately 38 per cent of the total market sales**.

The visualization of heatmap also shows the contribution of geographies, with almost a half of the total revenue being contributed by the **United States and Canada**. This is complemented by the charts of pricing distribution that show that the **average unit price of**

Assignment 2

\$528 is skewed towards the upside by the good brands. The dashboard is a good executive level market snapshot which provides easy information about financial health, segment performance and demand behavior.

Dashboard 2:

The second dashboard decomposes financial performance by country / sales channel, showing the contribution of various markets and distribution channels to the mobile ecosystem. The bar and line charts show that the **USA has the highest amount of revenue** in all markets totaling **\$3.20B**, followed by **Canada and UK with 2.63B and 2.14B respectively**.

Variations in the purchasing behavior of the consumer are also identified in this dashboard. In the USA and UK, the online channels prevail, and online sales contribute **37.7% of the total sales to the world** and have the **highest growth rate**. In Canada and Germany, retailing channels are robust and the consumers are more interested in having physical contacts with the product. Carrier sales, which comprise **27.7% of revenue**, are heavily dependent regionally with the highest percentage being that of North America.

Channel segmentation analysis is a complement to regional analysis that demonstrates massive ROI prospects of online-first sales approaches so that the decision-makers could make precise marketing budgets.

Assignment 2

Dashboard 3:

The third dashboard identifies the direct relationship between customer sentiment and financial performance. It is evident (scatterplots, correlation matrices) that customer rating and total revenue are positively correlated with **R-value of 0.62**, which is significant enough to make strategic operation focus on the product quality.

Customer rating models with a **rating that is more than 4.5** in customer rating will on average **earn a greater revenue per quarter** than the ones that have a **rating of less than 3.8**. The top performing models are also presented in the dashboard, with **Apple Model X Pro and Samsung 13 Ultra each having over 300M in revenue**. Moreover, the dashboard also identifies models that are performing poorly which need to be redesigned or scrapped because of poor rating and low sales momentum

The aggregate effect of the visualizations is that the brands get to know the product attributes that are important to consumers so they can develop more focused R&D and marketing strategies.
